/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site 1: Not 1; Site 2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NDHL19W, testis NHT, and B-cell NCL_CGAP_CCB1) were mixed, and ss circles were made in vitro. POllowing HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302007, 682632-687239, 726408-72811, and 729096-731399. Subtraction by Bento Soares and M. Patima Bonaldo. "

This insertion position refers to the first base of the 8 base target recognition sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 GGACCTCGTCTACTAGTTACCGAGTAAGGAAATGTGCCGGACTTTTGCGGCGAGAA 60

Direct Submission
Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing
project. Sanger Center, The Wellcome Trust Genome Campus, Hinxton,
Cambridge CB10 1SA, E-mail: Darrell@sanger.ac.uk and
nh@sanger.ac.uk
constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TRED927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution the library construction is
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects.
Barrell, School University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         32 GGAAATGTGCCGGACTTTTGCGGCGAGAGGCGAAAGTCTCAGTCGCTCTCCGAACTCCA 91

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination

υ

Claim 3; SEQ ID NO 8802; 2537pp + Sequence Listing; English.

```
complementary strand of a polymelectide which comprises a sequence and an oligonuclectide which comprises a sequence complementary to a polymuclectide which comprises a 3'-end sequence complementary to a oligonuclectide which comprises at 3'-end sequence complementary to a oligonuclectide comprises at least 15 nuclectides and the combination of the 5'-end sequence 15 selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polymuclectides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and sequences; AAH03166 to AAH33628 and AAH33612 to AAH13613 to AAH13613 to AAH13613 to AAH13613 to AAH13613 represent human amino acid sequences; and AAH13629 to AAH13612 represent colligonuclectides, all of which are used in the exemplification of the

the fusion proteins AABS1380-B51431. The genes can be used to generate fusion proteins AABS1380-B51431. The genes can be used to generate fusion proteins by linking to the gene for the human common proteins by linking to the gene for the human control of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the disgnosis, treatment and prevention of: (a) cancer, e.g. breast and cancer, and other cancers of the addrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune discretes e.g. Addison's disease, allegyles, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) candiovascular discretial ischemias; (d) wound healing candiovascular discretial ischemias; (d) wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1221 cerreacreceadeacereraceaacadaraaderagareceerregeereraaarar 1280

The invention relates to nucleic acid sequences (AAVB4411 to AAVB4633)

cocding human secreted proteins (AAWB8534 to AAWB6756). The secreted

protein gene sequences are deposited with the ATCC under deposit numbers

proteins (I) and polynucleotide (II) sequences. (I) and (II) have various activities based on the tissues and cells the genes are expressed in. Example of these activities include: immunomodulatory; anticlerotic; dermatological; immunosupressive; antiinflammatory; immunostimulant; antipartinsonian; antimulant; antiantiant; antiantial antial antial argument, antipartinsonian; antimulant; antiparkinsonian; antimulant; and vulnerary. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in the prevention, diagnosis and treatment of immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immunodeficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gauchers disease), cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, allowing wound healing, regeares), infectious diseases and value for promoting wound healing, regeneration and/or chemotaxis.                                                                                                                                 Homo sapiens
                                                                                                                                                                                 04-DEC-1998;
                                                                                                                                                                                                                                                                                                                                                                                  06-JUN-1997
                                                                                                                                                                25~FEB-2003
                                                                                                                                                                                                                                06-JUN-1997
```

The invention relates to an isolated HEMAEBO protein. The protein is useful for preparing a composition for diagnosing or treating autoimmune disorders e.g. multiple sclerosis and systemic lupus erythematogus; disorders e.g. multiple sclerosis and systemic lupus erythematogus; classis and attaxia telangiectasia; blood coagulation disorders e.g. afibrinogenaemia and treamboortopenia; allergy; graft-versus-host disease; inflammatory conditions e.g. ischaemia-repertiation injury and arthritis; hyperproliferative disorders e.g. cancer and purpura; infectious disease; c.g. viral infection and bacterial infection. The polynucleotide or protein can be used to regenerate damaged tissue e.g. ulcers and Alzheimer's disease. The present sequence represents a novel human secreted protein cDMA. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from uspro.

segdata.uspto.gov/sequence.html?DocID=20030065160

New isolated protein, useful for preparing a composition for diagnosing or treating cancer, inflammatory, immune or infectious diseases.

Example 1; SEQ ID NO 97; 172pp; English

rheumatoid arthritis, sepsis, acne, psoriasis) and cancer. The present sequence is one of the 238 disclosed cDMAs encoding a novel secreted protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at:- seqdata.uspto.gov/sequence.html?DocID=6525174B1

HERE THE SECOND COURSE AND THE SECOND COURSE SECOND SECOND

```
The invention relates to an isolated protein comprising amino acid residues 33-205 or 1-205 of a a novel human secreted protein appearing as BAD26252. The protein is encoded by one of 238 disclosed cDNA sequences encoding 238 secreted proteins. ABD36252 is a precerbellin-like protein. Also included are a composition comprising the protein and a carrier and an isolated protein produced by expressing the protein cited above by a cell, and recovering the protein. The protein sare useful for diagnosing or treating neurodegenerative and behavioural disorders (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, schizophrenia, mania, dementia, paranoia, psychoses or autism), immune disorders (e.g. hepatchlastoma, jaundice, hepatlitis), immunological disorders (e.g. AlDS, leukaemia, jaundice, hepatlitis), immunological disorders (e.g. AlDS, leukaemia,
New precerebellin-like protein, useful for diagnosing or treating neurodegenerative and behavioral disorders, immune disorders, liver
```

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the darenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital, (b) immune

1587 1588 CCCAGTGTCTTCAGGTTTCCCAAGACCACTTCCCTGTGGGCTTCCAAAAATGGCCTTTATC 1647 disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length 64 GAAAGICICAGICGCITICCGAACTCCACGIAAACGIGICCTCAAGACGCAAAAAI 123 Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss. The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 1528 ccricaciccaccaccircaccaacagaraacicaarcacarcccriggcorreraarai 4 CCTIGICTACTAGICCCTTACCGAGIAAGGAAAIGIACCGGACITTIGCGGCGAGAAGGI 0; Gaps Yamamoto Match

nucleotide sequences defined in the specification, where the cligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polyuncleotide which comprises a 5' end sequence and an oligonucleotide which comprises a 3' end sequence, where the comprises at least 15 nucleotides and the combination of the 5' end sequence/3' end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in cypenicalization. The primer sets can be used in antisense therapy and in cypericularly full-length cDNAs. The primers are also useful for the primers are useful for synthesising polynucleotides, comprised the primers and low obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAH13633 to AAH13632 represent human cDNA sequences; AAB92446 to AAB95893 crepresent human amino acid sequences, and AAH13632 represent colligonucleotides, all of which are used in the exemplification of the 2140 2141 ccchdigicittcadgifficcchdriccctdrogdctrcchapardgccrffarc 2200 GAAAGTCTCAGTCGCTTTCCGAACTCCACGTAAACGTGCTCCTAAGACGCCAAACAAT 123 2081 CCTTCACTCCCAGCACCTTGCCCAACAGGATAAGCTGGATCCCCTTGGCCTTCTGAATAT 4 CCTIGICIACIAGICCCTIACCGAGIAAGGAAAIGIACCGGACTITIGCGGCGAGAAGGI Human, nootropic, immunosuppressant; cytostatic; gene therapy; cancer peripheral nervous system; CNS; Alzheimer's, Parkinson's disease; Huntington's disease; harmington's disease; hameingtatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation; . 0 / Match 23.2%; Score 30.6; DB 4; Length 2510; Local Similarity 52.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                         The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM8642-AAM4213) with nootropic, immunosuppersant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system classed neuropathies and central nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral solerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, archer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               379 cccácicirroadsiricceaadaccácriccerdiceceirocaaaardecerriare 320

The proteins and their coding sequences are useful for treating a disease associated with NF-kappaB activation, such as inflammation, autoimmune diseases, cancers, infectious diseases, bone diseases, AIDS, neurodegenerative diseases, or ischaemic disorders.

GENOME HUMAN (HUMA-) Ruben Barash SC, Rosen CA,

S

WPI; 2001-483426/52

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis

Listing; English Disclosure; SEQ ID NO 40447; 3071pp + Sequence AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleorides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For

                                                                                                                                                                                                                                                                                                                       21225 cecadroretreadoriteceaadaeceaerrecerdrogeerrecaaarddeerrrare 21284
example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polymucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polymucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK8764 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK4942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                 64 GAAAGTCTCAGTCGCTTTCCGAACTCCACGTAAACGTGTGCTCCTAAGACGGCAAACAAT 123

3224 human nervous system antigen polypeptides, diagnosing and/or treating nervous system cancers Nucleic acids encoding useful for preventing, and metastases.

Disclosure; SEQ ID NO 8415; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) and sequences given in AAM81170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polymucleotides may be used to produce the secreted (I). by inserting the nucleic acids into a host cell and culturing the cell to express the nucleic acids into a host cell and culturing the cell to express the diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic artisen genomic centers from the present invanted maximum elemantopoietic artisen genomic sequences from the present invantion. AAK54992 to AAK54950 and AAM82169 represent invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 40448; 3071pp + Sequence Listing; English.

```

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases. invention relates to novel genes (ABA11004-ABA21534) and proteins Disclosure; SEQ ID NO 8416; 1701pp + Sequence Listing; English.

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.

WPI; 2002-435328/46.

Claim 1; SEQ ID NO 142; 114pp; English.

```
The interaction retailed for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and oversian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections alseases such as wiral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form directly the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 22026 BP; 5289 A; 5044 C; 5030 G; 6663 T; 0 U; 0 Other;

The invention relates to detecting (M1) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level in an unactivated GC, where differential expression of GS is indicative of GCA. Also included are additioned in the capture of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in GS; (S) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (M4) an inflammation (especially chronic) in a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression of the gene is indicative of inflammation; (4) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an allergic response in a classue, by contacting a tissue having inflammation (especially chronic) or in a tissue, an allergic response in a tissue, an allergic response in a tissue, an allergic response in a subject, to a pathogen or sterile inflammation (especially chronic) in a tissue, an allergic response in a subject to exposure of a subject to a pathogen or sterile inflammation (especially chronic) in a tissue, an allergic response in a subject, conscienting an especially chronic) in a tissue, an allergic response in a subject, conscients, and allergic response in a subject, conscients and a tissue, an allergic response in a subject, conscients and attended and arthritis, glomerulonephritis, asthma, thrombosis, checkpital or inflammatory distress syndrome, inflammatory bowel disease, Crohn's adult

disease, ulcerative colitis, periodontal disease, also bacterial infection, viral infection, parabitic infection, protozoal infection, fungal infection and M5 is useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig.wipo.int/pub/published_pct_sequences

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 41896, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster;

FILE REPRESENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-00-17

NUMBER OF SEQ ID NOS: 62517

SEQ ID NO 41896

LENGTH: 323

LENGTH: 323
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 37, Application US/08630915A

Patent No. 630920

GENERAL INPORMATICAN:
APPLICANT: SPARKS, Andrew B.
APPLICANT: FOWLKES, Dana M.
APPLICANT: KAY, Brian K.
APPLICANT: KAY, Brian K.
APPLICANT: KAY, Brian K.
APPLICANT: MCCONNELL, Stephen J.
TITLE OF INVENTION: POLYPEPTIDES HAVING A FUNCTIONAL
TITLE OF INVENTION: USING SAME
NUMBER OF SEQUENCES: 227
CORRESPONDENCE ADDRESS:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Note: two forms of the inhibitor were isolated; the amino end of the longer form is black.
A;Note: two forms of the inhibitor were form
C;Comment: This protein inhibits elastese and trypsin simultaneously and independently.
C;Comment: This protein inhibits elastese and trypsin simultaneously and independently.
C;Superfamily: Bowman-Birk proteinase inhibitor; Bowman-Birk inhibitor repeat homology will blocked amino end; duplication; serine proteinase inhibitor
F;18-44/Domain: Bowman-Birk inhibitor repeat homology will be proteined inhibitor repeat homology will be proteined.
